

The AquaPhase Family of Medical Equipment Washers

The AquaPhase family of Medical Equipment Washers ranges from a model which washes the cassettes used in the CISA ERS endoscope reprocessing unit, to our latest model which accommodates bariatric sized hospital beds (see overleaf).

AQ3000

AQ4000PTBS SaniPhase Bariatric Bed PassThrough

The most popular models have been the AQ3000 which takes, for example, one wheelchair, two commodes, or up to 8 walking frames at a time, and the AQ4000PT 'SaniPhase' which has a door at either end so that dirty equipment can be put in at one end, and the cleaned equipment taken out in a clean area, and can take a choice from multiple smaller items to equipment sized up to that of a standard hospital bed.

The Benefits of the AquaPhase Range

Disinfection: Uses chemical rather than thermal disinfection which means lower energy costs, improved Health & Safety, and less risk of damage to heat labile materials. (If thermal disinfection is your preference ask about our CISA range of steam based washer disinfectors.)

Water usage: Clean fresh water used for rinsing, previous cycle water recycled for next wash cycle

Track and Trace: Optional audit trail computer and software

Simplicity: Compact, small footprint, self-contained units, wheeled for easy repositioning, and no need for special building works

Market Leader: In more than 100 hospitals and community stores across the UK: purchased because these customers appreciate the effectiveness of a unit specifically designed for purpose.

Read the article from [Inside Hospitals](#) overleaf and contact us for a discussion as to how we can help you design or adapt your facility for effective medical equipment reprocessing and reduce the risks of cross-contamination.
